Visualisation

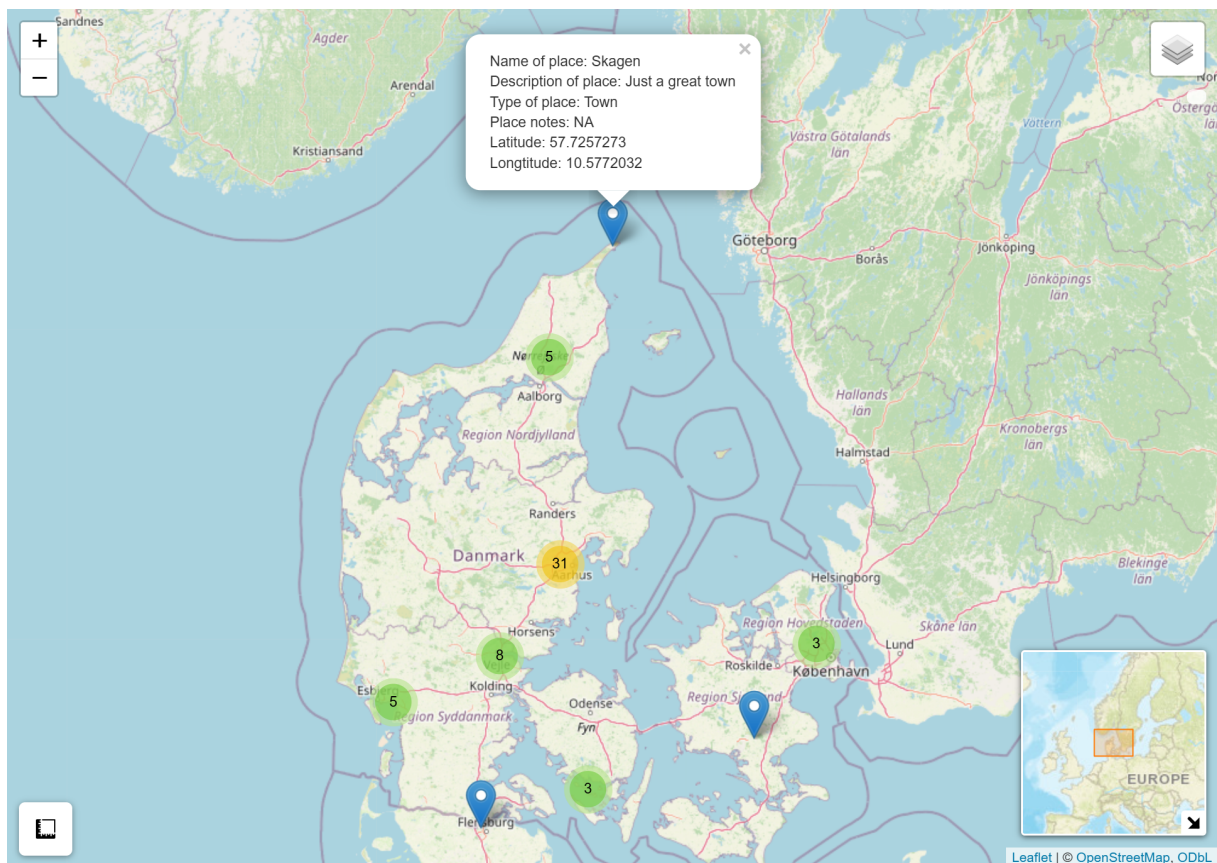

Figure 1: Map of Denmark with a collection of leisure places or places marked, which are collected in clusters.

Significance

Explain what your visualisation represents and its implications (≈ 250 words).

The visualisation in Figure 1 shows a map of Denmark, where we have used the coordinates from a selection of leisure places or places, to mark these according to where they can be found in Denmark. Each mark on the map contains the name of the place, a description of the place, what type they are, extra notes regarding the place and the coordinates for the place. The coordinates are separated into latitude and longitude respectively. Looking at

Figure 1 we used the marker *Skagen*, which is the town closest to the tip of Denmark, to demonstrate the information the marker shows. This location also makes it possible for us to still see the 31 leisure places located around the city of Aarhus.

The map from Figure 1 shows that a large collection of leisure places is located within and around Aarhus. Since the leisure places were collected by students studying in Aarhus, it thereby makes sense that the majority of locations by students are situated in this area. It can also be assumed that this is also a causality of students living in Aarhus and thereby making it be more natural to know about the local specialities within Aarhus. Using cluster maps is a great way to bundle leisure places together making a comparison such as this possible.
